Title of the article: *A Database Selection Expert System Based on*

The content extracted is as follows:

We developed a prototype, Web-based database selection expert system based on reference librarian's database selection strategy.

This system allows users to simultaneously search all databases available to identify databases most relevant to their requests using free-text keywords or phrases taken directly from their research topics.

This system allows users to simultaneously search all databases available to identify databases most relevant to their requests using free-text keywords or phrases taken directly from their research topics.

We developed a prototype, Web-based database selection expert system based on reference librarian's database selection strategy.

This system allows users to simultaneously search all databases available to identify databases most relevant to their requests using free-text keywords or phrases taken directly from their research topics.

The past decade has seen an explosion in the numbers and types of electronic information resources available to identify and retrieve articles and other information relevant to a scholar's research needs. Librarian users are confronted with a myriad of online, CD-ROM bibliographic and full-text databases, and other digital information resources. Past practices; used by academic libraries i.e., those that rely on in-person consultation with librarians or that expect end users to select from simple menus of available resources are not enough. Improvements are needed in the way libraries facilitate the on-line database election process, especially for the increasing number of end-users who access library resources; remotely.

We developed a prototype, Web-based database selection expert system based on reference librarian's database selection strategy.

This system allows users to simultaneously search all databases available to identify databases most relevant to their requests using free-text keywords or phrases taken directly from their research topics.

This system allows users to simultaneously search all databases available to identify databases most relevant to their requests using free-text keywords or phrases taken directly from their research topics.

Literature Review

uation of expert systems developed for database selection, The evaluation did not use recall and precision (iii) to measure the effectiveness of the system performance.

all precision ratio

Based on the Database Selector system that we have developed, taking into account the methods that Adelman and Lane described. We designed evaluation criteria that would meet our social environment and needs.

Fat J. Ibrahim v User Craup

For the purpose of developing and maintaining an electronic database advisory system as described in this study, it would be ideal if an agreement could be made between the subscriber

inc institution and the database producer/vendor at the time of subscription agreement to provide electronic thesauri, or to set up a Web site or FTP sitC for routine downloading and updating of thesauri.
